

Array Methods

Python has a set of built-in methods that you can use on lists/arrays.

Method	Description
append()	Adds an element at the end of the list
clear()	Removes all the elements from the list
copy()	Returns a copy of the list
count()	Returns the number of elements with the specified value
extend()	Add the elements of a list (or any iterable), to the end of the current list
index()	Returns the index of the first element with the specified value
insert()	Adds an element at the specified position
pop()	Removes the element at the specified position
remove()	Removes the first item with the specified value
reverse()	Reverses the order of the list
sort()	Sorts the list

Python List/Array MethodS

Python has a set of built-in methods that you can use on lists/arrays.

Method	Description
<code>append()</code>	Adds an element at the end of the list
<code>clear()</code>	Removes all the elements from the list
<code>copy()</code>	Returns a copy of the list
<code>count()</code>	Returns the number of elements with the specified value
<code>extend()</code>	Add the elements of a list (or any iterable), to the end of the current list
<code>index()</code>	Returns the index of the first element with the specified value
<code>insert()</code>	Adds an element at the specified position
<code>pop()</code>	Removes the element at the specified position
<code>remove()</code>	Removes the first item with the specified value
<code>reverse()</code>	Reverses the order of the list
<code>sort()</code>	Sorts the list

Python String Methods

Python has a set of built-in methods that you can use on strings.

Note: All string methods return new values. They do not change the original string.

Method	Description
<code>capitalize()</code>	Converts the first character to uppercase
<code>casefold()</code>	Converts a string into lowercase
<code>center()</code>	Returns a centered string
<code>count()</code>	Returns the number of times a specified value occurs in a string
<code>encode()</code>	Returns an encoded version of the string
<code>endswith()</code>	Returns true if the string ends with the specified value
<code>expandtabs()</code>	Sets the tab size of the string
<code>find()</code>	Searches the string for a specified value and returns the position of where it was found
<code>format()</code>	Formats specified values in a string
<code>format_map()</code>	Formats specified values in a string
<code>index()</code>	Searches the string for a specified value and returns the position of where it was found

<u>isalnum()</u>	Returns True if all characters in the string are alphanumeric
<u>isalpha()</u>	Returns True if all characters in the string are in the alphabet
<u>isascii()</u>	Returns True if all characters in the string are ascii characters
<u>isdecimal()</u>	Returns True if all characters in the string are decimals
<u>isdigit()</u>	Returns True if all characters in the string are digits
<u>isidentifier()</u>	Returns True if the string is an identifier
<u>islower()</u>	Returns True if all characters in the string are lowercase
<u>isnumeric()</u>	Returns True if all characters in the string are numeric
<u>isprintable()</u>	Returns True if all characters in the string are printable
<u>isspace()</u>	Returns True if all characters in the string are whitespaces
<u>istitle()</u>	Returns True if the string follows the rules of a title
<u>isupper()</u>	Returns True if all characters in the string are upper-case
<u>join()</u>	Converts the elements of an iterable into a string
<u>ljust()</u>	Returns a left-justified version of the string

<u>lower()</u>	Converts a string into lowercase
<u>lstrip()</u>	Returns a left trim version of the string
<u>maketrans()</u>	Returns a translation table to be used in translations
<u>partition()</u>	Returns a tuple where the string is parted into three parts
<u>replace()</u>	Returns a string where a specified value is replaced with a specified value
<u>rfind()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rindex()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rjust()</u>	Returns a right justified version of the string
<u>rpartition()</u>	Returns a tuple where the string is parted into three parts
<u>rsplit()</u>	Splits the string at the specified separator, and returns a list
<u>rstrip()</u>	Returns a right trim version of the string
<u>split()</u>	Splits the string at the specified separator, and returns a list
<u>splitlines()</u>	Splits the string at line breaks and returns a list

<u>startswith()</u>	Returns true if the string starts with the specified value
<u>strip()</u>	Returns a trimmed version of the string
<u>swapcase()</u>	Swaps cases, the lower case becomes the upper case, and vice versa
<u>title()</u>	Converts the first character of each word to upper case
<u>translate()</u>	Returns a translated string
<u>upper()</u>	Converts a string into upper case
<u>zfill()</u>	Fills the string with a specified number of 0 values at the beginning

Python Built-in Functions

Python has a set of built-in functions.

Function	Description
<code>abs()</code>	Returns the absolute value of a number
<code>all()</code>	Returns True if all items in an iterable object are true
<code>any()</code>	Returns True if any item in an iterable object is true
<code>ascii()</code>	Returns a readable version of an object. Replaces none-ascii characters with escape character
<code>bin()</code>	Returns the binary version of a number
<code>bool()</code>	Returns the boolean value of the specified object
<code>bytearray()</code>	Returns an array of bytes
<code>bytes()</code>	Returns a bytes object
<code>callable()</code>	Returns True if the specified object is callable, otherwise False
<code>chr()</code>	Returns a character from the specified Unicode code.
<code>classmethod()</code>	Converts a method into a class method

<code>compile()</code>	Returns the specified source as an object, ready to be executed
<code>complex()</code>	Returns a complex number
<code>delattr()</code>	Deletes the specified attribute (property or method) from the specified object
<code>dict()</code>	Returns a dictionary (Array)
<code>dir()</code>	Returns a list of the specified object's properties and methods
<code>divmod()</code>	Returns the quotient and the remainder when argument1 is divided by argument2
<code>enumerate()</code>	Takes a collection (e.g. a tuple) and returns it as an enumerate object
<code>eval()</code>	Evaluates and executes an expression
<code>exec()</code>	Executes the specified code (or object)
<code>filter()</code>	Use a filter function to exclude items in an iterable object
<code>float()</code>	Returns a floating point number
<code>format()</code>	Formats a specified value
<code>frozenset()</code>	Returns a frozenset object

<code>getattr()</code>	Returns the value of the specified attribute (property or method)
<code>globals()</code>	Returns the current global symbol table as a dictionary
<code>hasattr()</code>	Returns True if the specified object has the specified attribute (property/method)
<code>hash()</code>	Returns the hash value of a specified object
<code>help()</code>	Executes the built-in help system
<code>hex()</code>	Converts a number into a hexadecimal value
<code>id()</code>	Returns the id of an object
<code>input()</code>	Allowing user input
<code>int()</code>	Returns an integer number
<code>isinstance()</code>	Returns True if a specified object is an instance of a specified object
<code>issubclass()</code>	Returns True if a specified class is a subclass of a specified object
<code>iter()</code>	Returns an iterator object
<code>len()</code>	Returns the length of an object

<code>list()</code>	Returns a list
<code>locals()</code>	Returns an updated dictionary of the current local symbol table
<code>map()</code>	Returns the specified iterator with the specified function applied to each item
<code>max()</code>	Returns the largest item in an iterable
<code>memoryview()</code>	Returns a memory view object
<code>min()</code>	Returns the smallest item in an iterable
<code>next()</code>	Returns the next item in an iterable
<code>object()</code>	Returns a new object
<code>oct()</code>	Converts a number into an octal
<code>open()</code>	Opens a file and returns a file object
<code>ord()</code>	Convert an integer representing the Unicode of the specified character
<code>pow()</code>	Returns the value of x to the power of y
<code>print()</code>	Prints to the standard output device

<code>property()</code>	Gets, sets, deletes a property
<code>range()</code>	Returns a sequence of numbers, starting from 0 and increments by 1 (by default)
<code>repr()</code>	Returns a readable version of an object
<code>reversed()</code>	Returns a reversed iterator
<code>round()</code>	Rounds a numbers
<code>set()</code>	Returns a new set object
<code>setattr()</code>	Sets an attribute (property/method) of an object
<code>slice()</code>	Returns a slice object
<code>sorted()</code>	Returns a sorted list
<code>staticmethod()</code>	Converts a method into a static method
<code>str()</code>	Returns a string object
<code>sum()</code>	Sums the items of an iterator
<code>super()</code>	Returns an object that represents the parent class

[tuple\(\)](#)

Returns a tuple

[type\(\)](#)

Returns the type of an object

[vars\(\)](#)

Returns the `__dict__` property of an object

[zip\(\)](#)

Returns an iterator, from two or more iterators

Python Dictionary Methods

Python has a set of built-in methods that you can use on dictionaries.

Method	Description
<code>clear()</code>	Removes all the elements from the dictionary
<code>copy()</code>	Returns a copy of the dictionary
<code>fromkeys()</code>	Returns a dictionary with the specified keys and value
<code>get()</code>	Returns the value of the specified key
<code>items()</code>	Returns a list containing a tuple for each key value pair
<code>keys()</code>	Returns a list containing the dictionary's keys
<code>pop()</code>	Removes the element with the specified key
<code>popitem()</code>	Removes the last inserted key-value pair
<code>setdefault()</code>	Returns the value of the specified key. If the key does not exist: insert the key, with the specified value
<code>update()</code>	Updates the dictionary with the specified key-value pairs
<code>values()</code>	Returns a list of all the values in the dictionary

Python Tuple Methods

Python has two built-in methods that you can use on tuples.

Method	Description
<code>count()</code>	Returns the number of times a specified value occurs in a tuple
<code>index()</code>	Searches the tuple for a specified value and returns the position of where it was found

Python Set Methods

Python has a set of built-in methods that you can use on sets.

Method	Description
<code>add()</code>	Adds an element to the set
<code>clear()</code>	Removes all the elements from the set
<code>copy()</code>	Returns a copy of the set
<code>difference()</code>	Returns a set containing the difference between two or more sets
<code>difference_update()</code>	Removes the items in this set that are also included in another, specified set
<code>discard()</code>	Remove the specified item
<code>intersection()</code>	Returns a set, that is the intersection of two or more sets
<code>intersection_update()</code>	Removes the items in this set that are not present in other, specified set(s)
<code>isdisjoint()</code>	Returns whether two sets have a intersection or not
<code>issubset()</code>	Returns whether another set contains this set or not
<code>issuperset()</code>	Returns whether this set contains another set or not

[pop\(\)](#)

Removes an element from the set

[remove\(\)](#)

Removes the specified element

[symmetric_difference\(\)](#)

Returns a set with the symmetric differences of two sets

[symmetric_difference_update\(\)](#)

inserts the symmetric differences from this set and another

[union\(\)](#)

Return a set containing the union of sets

[update\(\)](#)

Update the set with another set, or any other iterable

Python File Methods

Python has a set of methods available for the file object.

Method	Description
<code>close()</code>	Closes the file
<code>detach()</code>	Returns the separated raw stream from the buffer
<code>fileno()</code>	Returns a number that represents the stream, from the operating system's perspective
<code>flush()</code>	Flushes the internal buffer
<code>isatty()</code>	Returns whether the file stream is interactive or not
<code>read()</code>	Returns the file content
<code>readable()</code>	Returns whether the file stream can be read or not
<code>readline()</code>	Returns one line from the file
<code>readlines()</code>	Returns a list of lines from the file
<code>seek()</code>	Change the file position
<code>seekable()</code>	Returns whether the file allows us to change the file position

<u>tell()</u>	Returns the current file position
<u>truncate()</u>	Resizes the file to a specified size
<u>writable()</u>	Returns whether the file can be written to or not
<u>write()</u>	Writes the specified string to the file
<u>writelines()</u>	Writes a list of strings to the file

Python Keywords

Python has a set of keywords that are reserved words that cannot be used as variable names, function names, or any other identifiers:

Keyword	Description
<u>and</u>	A logical operator
<u>as</u>	To create an alias
<u>assert</u>	For debugging
<u>break</u>	To break out of a loop
<u>class</u>	To define a class
<u>continue</u>	To continue to the next iteration of a loop
<u>def</u>	To define a function
<u>del</u>	To delete an object
<u>elif</u>	Used in conditional statements, same as else if
<u>else</u>	Used in conditional statements
<u>except</u>	Used with exceptions, what to do when an exception occurs

<u>False</u>	Boolean value, result of comparison operations
<u>finally</u>	Used with exceptions, a block of code that will be executed no matter if there is an exception or not
<u>for</u>	To create a for loop
<u>from</u>	To import specific parts of a module
<u>global</u>	To declare a global variable
<u>if</u>	To make a conditional statement
<u>import</u>	To import a module
<u>in</u>	To check if a value is present in a list, tuple, etc.
<u>is</u>	To test if two variables are equal
<u>lambda</u>	To create an anonymous function
<u>None</u>	Represents a null value
<u>nonlocal</u>	To declare a non-local variable
<u>not</u>	A logical operator

<u>or</u>	A logical operator
<u>pass</u>	A null statement, a statement that will do nothing
<u>raise</u>	To raise an exception
<u>return</u>	To exit a function and return a value
<u>True</u>	Boolean value, result of comparison operations
<u>try</u>	To make a try...except statement
<u>while</u>	To create a while loop
with	Used to simplify exception handling
yield	To end a function, returns a generator

Python Glossary

This is a list of all the features explained in the Python Tutorial.

Feature	Description
Indentation	Indentation refers to the spaces at the beginning of a code line
Comments	Comments are code lines that will not be executed
Multiline Comments	How to insert comments on multiple lines
Creating Variables	Variables are containers for storing data values
Variable Names	How to name your variables
Assign Values to Multiple Variables	How to assign values to multiple variables
Output Variables	Use the print statement to output variables
String Concatenation	How to combine strings
Global Variables	Global variables are variables that belongs to the global scope
Built-In Data Types	Python has a set of built-in data types
Getting Data Type	How to get the data type of an object

[Setting Data Type](#)

How to set the data type of an object

[Numbers](#)

There are three numeric types in Python

[Int](#)

The integer number type

[Float](#)

The floating number type

[Complex](#)

The complex number type

[Type Conversion](#)

How to convert from one number type to another

[Random Number](#)

How to create a random number

[Specify a Variable Type](#)

How to specify a certain data type for a variable

[String Literals](#)

How to create string literals

[Assigning a String to a Variable](#)

How to assign a string value to a variable

[Multiline Strings](#)

How to create a multiline string

[Strings are Arrays](#)

Strings in Python are arrays of bytes representing Unicode characters

[Slicing a String](#)

How to slice a string

[Negative Indexing on a String](#)

How to use negative indexing when accessing a string

[String Length](#)

How to get the length of a string

[Check In String](#)

How to check if a string contains a specified phrase

[Format String](#)

How to combine two strings

[Escape Characters](#)

How to use escape characters

[Boolean Values](#)

True or False

[Evaluate Booleans](#)

Evaluate a value or statement and return either True or False

[Return Boolean Value](#)

Functions that return a Boolean value

[Operators](#)

Use operator to perform operations in Python

[Arithmetic Operators](#)

Arithmetic operator are used to perform common mathematical operations

[Assignment Operators](#)

Assignment operators are use to assign values to variables

[Comparison Operators](#)

Comparison operators are used to compare two values

[Logical Operators](#)

Logical operators are used to combine conditional statements

[Identity Operators](#)

Identity operators are used to see if two objects are in fact the same object

[Membership Operators](#)

Membership operators are used to test if a sequence is present in an object

[Bitwise Operators](#)

Bitwise operators are used to compare (binary) numbers

[Lists](#)

A list is an ordered, and changeable, collection

[Access List Items](#)

How to access items in a list

[Change List Item](#)

How to change the value of a list item

[Loop Through List Items](#)

How to loop through the items in a list

[List Comprehension](#)

How use a list comprehensive

[Check if List Item Exists](#)

How to check if a specified item is present in a list

[List Length](#)

How to determine the length of a list

[Add List Items](#)

How to add items to a list

[Remove List Items](#)

How to remove list items

[Copy a List](#)

How to copy a list

[Join Two Lists](#)

How to join two lists

[Tuple](#)

A tuple is an ordered, and unchangeable, collection

[Access Tuple Items](#)

How to access items in a tuple

[Change Tuple Item](#)

How to change the value of a tuple item

[Loop List Items](#)

How to loop through the items in a tuple

[Check if Tuple Item Exists](#)

How to check if a specified item is present in a tuple

[Tuple Length](#)

How to determine the length of a tuple

[Tuple With One Item](#)

How to create a tuple with only one item

[Remove Tuple Items](#)

How to remove tuple items

[Join Two Tuples](#)

How to join two tuples

[Set](#)

A set is an unordered, and unchangeable, collection

[Access Set Items](#)

How to access items in a set

[Add Set Items](#)

How to add items to a set

[Loop Set Items](#)

How to loop through the items in a set

[Check if Set Item Exists](#)

How to check if a item exists

[Set Length](#)

How to determine the length of a set

[Remove Set Items](#)

How to remove set items

[Join Two Sets](#)

How to join two sets

[Dictionary](#)

A dictionary is an unordered, and changeable, collection

[Access Dictionary Items](#)

How to access items in a dictionary

[Change Dictionary Item](#)

How to change the value of a dictionary item

[Loop Dictionary Items](#)

How to loop through the items in a tuple

[Check if Dictionary Item Exists](#)

How to check if a specified item is present in a dictionary

[Dictionary Length](#)

How to determine the length of a dictionary

[Add Dictionary Item](#)

How to add an item to a dictionary

[Remove Dictionary Items](#)

How to remove dictionary items

[Copy Dictionary](#)

How to copy a dictionary

[Nested Dictionaries](#)

A dictionary within a dictionary

[If Statement](#)

How to write an if statement

[If Indentation](#)

If statements in Python relies on indentation (whitespace at the beginning of a line)

[Elif](#)

elif is the same as "else if" in other programming languages

[Else](#)

How to write an if...else statement

[Shorthand If](#)

How to write an if statement in one line

[Shorthand If Else](#)

How to write an if...else statement in one line

[If AND](#)

Use the and keyword to combine if statements

[If OR](#)

Use the or keyword to combine if statements

[If NOT](#)

Use the not keyword to reverse the condition

[Nested If](#)

How to write an if statement inside an if statement

[The pass Keyword in If](#)

Use the pass keyword inside empty if statements

[While](#)

How to write a while loop

[While Break](#)

How to break a while loop

[While Continue](#)

How to stop the current iteration and continue with the next

[While Else](#)

How to use an else statement in a while loop

[For](#)

How to write a for loop

[Loop Through a String](#)

How to loop through a string

[For Break](#)

How to break a for loop

[For Continue](#)

How to stop the current iteration and continue with the next

[Looping Through a range](#)

How to loop through a range of values

[For Else](#)

How to use an else statement in a for loop

[Nested Loops](#)

How to write a loop inside a loop

[For pass](#)

Use the pass keyword inside empty for loops

[Function](#)

How to create a function in Python

[Call a Function](#)

How to call a function in Python

[Function Arguments](#)

How to use arguments in a function

[*args](#)

To deal with an unknown number of arguments in a function, use the * symbol before the parameter name

[Keyword Arguments](#)

How to use keyword arguments in a function

[**kwargs](#)

To deal with an unknown number of keyword arguments in a function, use the * symbol before the parameter name

[Default Parameter Value](#)

How to use a default parameter value

[Passing a List as an Argument](#)

How to pass a list as an argument

[Function Return Value](#)

How to return a value from a function

[The pass Statement in Functions](#)

Use the pass statement in empty functions

[Function Recursion](#)

Functions that can call itself is called recursive functions

[Lambda Function](#)

How to create anonymous functions in Python

[Why Use Lambda Functions](#)

Learn when to use a lambda function or not

[Array](#)

Lists can be used as Arrays

[What is an Array](#)

Arrays are variables that can hold more than one value

[Access Arrays](#)

How to access array items

[Array Length](#)

How to get the length of an array

[Looping Array Elements](#)

How to loop through array elements

[Add Array Element](#)

How to add elements from an array

[Remove Array Element](#)

How to remove elements from an array

[Array Methods](#)

Python has a set of Array/Lists methods

[Class](#)

A class is like an object constructor

[Create Class](#)

How to create a class

[The Class `__init__\(\)` Function](#)

The `__init__()` function is executed when the class is initiated

[Object Methods](#)

Methods in objects are functions that belongs to the object

[self](#)

The self parameter refers to the current instance of the class

[Modify Object Properties](#)

How to modify properties of an object

[Delete Object Properties](#)

How to modify properties of an object

[Delete Object](#)

How to delete an object

[Class pass Statement](#)

Use the pass statement in empty classes

[Create Parent Class](#)

How to create a parent class

[Create Child Class](#)

How to create a child class

[Create the __init__\(\) Function](#)

How to create the __init__() function

[super Function](#)

The super() function make the child class inherit the parent class

[Add Class Properties](#)

How to add a property to a class

[Add Class Methods](#)

How to add a method to a class

[Iterators](#)

An iterator is an object that contains a countable number of values

[Iterator vs Iterable](#)

What is the difference between an iterator and an iterable

[Loop Through an Iterator](#)

How to loop through the elements of an iterator

[Create an Iterator](#)

How to create an iterator

[StopIteration](#)

How to stop an iterator

[Global Scope](#)

When does a variable belong to the global scope?

[Global Keyword](#)

The global keyword makes the variable global

[Create a Module](#)

How to create a module

[Variables in Modules](#)

How to use variables in a module

[Renaming a Module](#)

How to rename a module

[Built-in Modules](#)

How to import built-in modules

[Using the dir\(\) Function](#)

List all variable names and function names in a module

[Import From Module](#)

How to import only parts from a module

[Datetime Module](#)

How to work with dates in Python

[Date Output](#)

How to output a date

[Create a Date Object](#)

How to create a date object

[The strftime Method](#)

How to format a date object into a readable string

[Date Format Codes](#)

The datetime module has a set of legal format codes

[JSON](#)

How to work with JSON in Python

[Parse JSON](#)

How to parse JSON code in Python

[Convert into JSON](#)

How to convert a Python object in to JSON

[Format JSON](#)

How to format JSON output with indentations and line breaks

[Sort JSON](#)

How to sort JSON

[RegEx Module](#)

How to import the regex module

[RegEx Functions](#)

The re module has a set of functions

[Metacharacters in RegEx](#)

Metacharacters are characters with a special meaning

[RegEx Special Sequences](#)

A backslash followed by a character has a special meaning

[RegEx Sets](#)

A set is a set of characters inside a pair of square brackets with a special meaning

[RegEx Match Object](#)

The Match Object is an object containing information about the

search and the result

[Install PIP](#)

How to install PIP

[PIP Packages](#)

How to download and install a package with PIP

[PIP Remove Package](#)

How to remove a package with PIP

[Error Handling](#)

How to handle errors in Python

[Handle Many Exceptions](#)

How to handle more than one exception

[Try Else](#)

How to use the else keyword in a try statement

[Try Finally](#)

How to use the finally keyword in a try statement

[raise](#)

How to raise an exception in Python
